

Little-oh notation

①

Recall: $f, g: \{1, 2, \dots\} \rightarrow \mathbb{R}^+$, $g(n) > 0$.

• $f(n) = O(g(n)) \iff \exists c$ for all sufficiently large n , $\frac{f(n)}{g(n)} \leq c$

• $f(n) = \Omega(g(n)) \iff \exists c > 0$ for all sufficiently large n , $\frac{f(n)}{g(n)} \geq c$

def $f(n) = o(g(n))$ if $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \text{zero}$

$f(n) = \omega(g(n))$ if $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \infty$

Exercise: Prove that

(1) $f(n) = o(g(n)) \implies f(n) = O(g(n))$ but not $f(n) = \Omega(g(n))$

(2) $f(n) = \omega(g(n)) \implies f(n) = \Omega(g(n))$ but not $f(n) = O(g(n))$

Ex: • $f(n) = \sqrt{n}$, $g(n) = n$; then $f(n) = o(g(n))$ because

$$\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{n} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} = 0$$

• $f(n) = n^{28}$, $g(n) = 2^n$; then $f(n) = o(g(n))$ because

$$\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \lim_{n \rightarrow \infty} \frac{n^{28}}{2^n} = 0 \quad \log \frac{1}{2}$$

~~$$\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \lim_{n \rightarrow \infty} \frac{n^{28}}{2^n}$$

$$\lim_{n \rightarrow \infty} \frac{28 n^{27}}{2^n} = \lim_{n \rightarrow \infty} \frac{27 n^{26}}{2^n} = \lim_{n \rightarrow \infty} \frac{26 n^{25}}{2^n} = \lim_{n \rightarrow \infty} \frac{25 n^{24}}{2^n} = \lim_{n \rightarrow \infty} \frac{24 n^{23}}{2^n} = \lim_{n \rightarrow \infty} \frac{23 n^{22}}{2^n} = \lim_{n \rightarrow \infty} \frac{22 n^{21}}{2^n} = \lim_{n \rightarrow \infty} \frac{21 n^{20}}{2^n} = \lim_{n \rightarrow \infty} \frac{20 n^{19}}{2^n} = \lim_{n \rightarrow \infty} \frac{19 n^{18}}{2^n} = \lim_{n \rightarrow \infty} \frac{18 n^{17}}{2^n} = \lim_{n \rightarrow \infty} \frac{17 n^{16}}{2^n} = \lim_{n \rightarrow \infty} \frac{16 n^{15}}{2^n} = \lim_{n \rightarrow \infty} \frac{15 n^{14}}{2^n} = \lim_{n \rightarrow \infty} \frac{14 n^{13}}{2^n} = \lim_{n \rightarrow \infty} \frac{13 n^{12}}{2^n} = \lim_{n \rightarrow \infty} \frac{12 n^{11}}{2^n} = \lim_{n \rightarrow \infty} \frac{11 n^{10}}{2^n} = \lim_{n \rightarrow \infty} \frac{10 n^9}{2^n} = \lim_{n \rightarrow \infty} \frac{9 n^8}{2^n} = \lim_{n \rightarrow \infty} \frac{8 n^7}{2^n} = \lim_{n \rightarrow \infty} \frac{7 n^6}{2^n} = \lim_{n \rightarrow \infty} \frac{6 n^5}{2^n} = \lim_{n \rightarrow \infty} \frac{5 n^4}{2^n} = \lim_{n \rightarrow \infty} \frac{4 n^3}{2^n} = \lim_{n \rightarrow \infty} \frac{3 n^2}{2^n} = \lim_{n \rightarrow \infty} \frac{2 n}{2^n} = \lim_{n \rightarrow \infty} \frac{2}{2^n} = 0$$~~

Ex: $f(n) = 2^n$, $g(n) = n!$ $f(n) = o(g(n))$

$$\begin{aligned}\lim_{n \rightarrow \infty} \frac{2^n}{n!} &= \lim_{n \rightarrow \infty} \frac{2 \cdot 2 \cdot 2 \cdots 2}{n \cdot (n-1) \cdot (n-2) \cdots 1} \\ &= \lim_{n \rightarrow \infty} \frac{2}{n} \cdot \frac{2}{n-1} \cdot \frac{2}{n-2} \cdots \frac{2}{2} \cdot \frac{2}{1} \\ &\leq \lim_{n \rightarrow \infty} \frac{2}{n} \cdot 1 \cdot 1 \cdots 1 \cdot 2 \\ &\leq \lim_{n \rightarrow \infty} \frac{4}{n} = 0\end{aligned}$$

Think:

$f(n) = o(g(n))$ means $f < g$

$f(n) = O(g(n))$ means $f \leq g$

$f(n) = \Omega(g(n))$ means $f \geq g$

$f(n) = \omega(g(n))$ means $f > g$

$f(n) = \Theta(g(n))$ means $f \approx g$

But careful:

Exercise: Find a pair of functions f, g such that

(.) $f(n) = O(g(n))$

(.) $f(n) = \Omega(g(n))$ does not hold

(.) $f(n) = \Theta(g(n))$ does not hold

Ex. Solution to Exercise:

2.1

• $g(n) = n$

• $f(n) = \begin{cases} n & n \text{ is even} \\ 1 & n \text{ is odd.} \end{cases}$

$\frac{f(n)}{g(n)} = \begin{cases} 1 & n \text{ is even} \\ 1/n & n \text{ is odd} \end{cases}$

• $\frac{f(n)}{g(n)} \leq 1 \Rightarrow f(n) = O(g(n))$

• Because $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)}$ is not defined, $f(n) = o(g(n))$ does not hold.

• Also, $f(n) = \Omega(g(n))$ does not hold.

A tale of two sums

3

① Let α be some number. A surprisingly common sum, is known as a geometric series, is

$$S = 1 + \alpha + \alpha^2 + \alpha^3 + \dots + \alpha^n$$
$$= \sum_{j=0}^n \alpha^j$$

Here is the trick to find the formula for S :

$$S = 1 + \alpha + \alpha^2 + \alpha^3 + \dots + \alpha^{n-1} + \alpha^n$$
$$\alpha \cdot S = \alpha + \alpha^2 + \alpha^3 + \dots + \alpha^{n-1} + \alpha^n + \alpha^{n+1}$$

So

$$S - \alpha \cdot S = 1 - 0 - 0 - 0 \dots - 0 - 0 - \alpha^{n+1}$$
$$= 1 - \alpha^{n+1}$$

And then $S(1-\alpha) = 1 - \alpha^{n+1}$, so

$$S = \frac{1 - \alpha^{n+1}}{1 - \alpha}$$

Also, if $|\alpha| < 1$, then

(4)

$$\begin{aligned} 1 + \alpha + \alpha^2 + \alpha^3 + \dots &= \sum_{j=0}^{\infty} \alpha^j \\ &= \lim_{n \rightarrow \infty} \sum_{j=0}^n \alpha^j \\ &= \lim_{n \rightarrow \infty} \frac{1 - \alpha^{n+1}}{1 - \alpha} \\ &= \frac{1}{1 - \alpha} \cdot \left(\lim_{n \rightarrow \infty} 1 - \alpha^{n+1} \right) \\ &= \boxed{\frac{1}{1 - \alpha}} \end{aligned}$$

Ex: ~~0.9999... = 1.9999... = 1~~

$$\begin{aligned} \frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} + \dots &= \left(\sum_{j=0}^{\infty} \left(-\frac{1}{2}\right)^j \right) \cdot \frac{1}{2} \\ &= \frac{1}{1 - (-\frac{1}{2})} \cdot \frac{1}{2} = \frac{1}{\frac{3}{2}} \cdot \frac{1}{2} \\ &= \frac{1}{3} \end{aligned}$$

② The harmonic series, ~~denoted~~ defined (5)

$$H_n = 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}$$

is also common.

$$\ln n < \ln(n+1) = (\ln(x+1)) \Big|_0^n = \int_0^n \frac{1}{x+1} dx \leq H_n$$

$$H_n \leq 1 + \int_1^n \frac{1}{x} dx = 1 + \ln n$$

Therefore:

$$\ln n < H_n \leq \ln n + 1 \quad \text{and}$$

$$H_n \approx \ln n \quad H_n = \Theta(\log n)$$

Ex: $T(n) = 2 \cdot T(\frac{n}{2}) + n^2$

Assume a reasonable base case
($T(1) = 1$)

k=0

$T(n) = n^2 + T(\frac{n}{2}) + T(\frac{n}{2})$

k=1

$(\frac{n}{2})^2 + 2 \cdot T(\frac{n}{4})$

$(\frac{n}{2})^2 + 2 \cdot T(\frac{n}{4})$

k=2

$(\frac{n}{4})^2$

$(\frac{n}{4})^2$

$(\frac{n}{4})^2$

$(\frac{n}{4})^2$

⋮

1 1 1

.....

1

depth	contribution/node	# nodes	total at depth
0	n^2	1	n^2
1	$(\frac{n}{2})^2$	2	$2 \cdot (\frac{n}{2})^2$
2	$(\frac{n}{4})^2$	4	$4 \cdot (\frac{n}{4})^2$
⋮			
k	$(\frac{n}{2^k})^2$	2^k	$2^k \cdot (\frac{n}{2^k})^2 = \frac{1}{2^k} \cdot n^2$
⋮			
$d = \lg n$	1	$2^d = n$	n

So, summing the contributions, we get

$$T(n) = \sum_{k=0}^d \frac{1}{2^k} \cdot n^2$$

$$= n^2 \left(1 + \frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^d} \right)$$

So $n^2 \leq T(n) \leq 2n^2$ because

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \dots = 2 \quad \text{and} \quad T(n) = \Theta(n^2).$$

Ex $T(n) = 3 \cdot T(n/3) + \frac{n}{\lg n}$

(8)

Assume base case $T(1) = 0$.

$$T(n) = \boxed{3 \cdot T(n/3) + \frac{n}{\lg n}}$$

$k=0$

$$3 \cdot T\left(\frac{n}{3^{k+1}}\right) + \frac{n/3^k}{\lg n/3^k}$$

k

depth	argument	work/node	total nodes	total work
0	n	$\frac{n}{\lg n}$	1	$\frac{n}{\lg n}$
1	n/3	$\frac{n/3}{\lg n/3}$	3	$\frac{n}{\lg n/3}$
2	n/9	$\frac{n/9}{\lg n/9}$	9	$\frac{n}{\lg n/9}$
⋮				
k	$n/3^k$	$\frac{n/3^k}{\lg n/3^k}$	3^k	$\frac{n}{\lg n/3^k}$
⋮				
d	1	1	3^d	0

The total depth of the recursion tree is

$$d = \log_3 n.$$

We get

$$\begin{aligned}
 T(n) &= \sum_{k=0}^{d-1} \frac{n}{\lg n/3^k} = n \sum_{k=0}^{d-1} \frac{1}{\lg n - k \cdot \lg 3} \\
 &= \frac{n}{\lg 3} \sum_{k=0}^{d-1} \frac{1}{\log_3 n - k} \\
 &= \frac{n}{\lg 3} \sum_{k=0}^{d-1} \frac{1}{d-k}
 \end{aligned}$$

$$= \frac{n}{\lg 3} \left(\frac{1}{d} + \frac{1}{d-1} + \frac{1}{d-2} + \dots + \frac{1}{1} \right)$$

$$= \frac{n}{\lg 3} \cdot H_d$$

$$\approx \frac{1}{\lg 3} \cdot n \ln d$$

$$\approx \frac{1}{\lg 3} \cdot n (\ln(\log_3 n))$$

$$= \Theta(n \ln \ln n)$$
