

Directions: Solve the following problems. All written work must be your own. See the course syllabus for detailed rules.

- [JJJ 1.46] Explain why the exclusive-or cipher is not secure against a chosen plaintext attack. Demonstrate the attack by computing the key given the plaintext/ciphertext pair with $m = 1100101001$ and $c = 0011001100$.
- [JJJ 1.48] Why modular arithmetic? Alice and Bob decide to use a multiplicative cipher that does not involve modular arithmetic. That is, they use $\mathcal{K} = \{p: p \text{ is a prime}\}$, $\mathcal{M} = \mathcal{C} = \{1, 2, 3, \dots\}$, and

$$e_k(m) = km$$

$$d_k(c) = c/k.$$

Eve intercepts the following ciphertexts:

$$c_1 = 19157632841654891 \quad c_2 = 39493517444969867 \quad c_3 = 32351977451572789$$

Illustrate that this cipher lacks property (3) by finding the key k .

- Modular exponentiation cipher. Consider the cipher where \mathcal{K} is the set of primitive roots in \mathbb{F}_p , $\mathcal{M} = \mathbb{Z}_{p-1}$, $\mathcal{C} = \mathbb{F}_p^*$, and $e_k(m) = k^m$.
 - Alice and Bob choose $p = 11$ and $k = 2$. Encrypt the message 6 and decrypt the message 3.
 - Prove that the encryption function is injective, and describe the decryption function.
 - Does this cipher have property (1) (i.e. given $k \in \mathcal{K}$ and $m \in \mathcal{M}$, it is easy to compute $e_k(m)$)? Does it have property (2) (i.e. given $k \in \mathcal{K}$ and $c \in \mathcal{C}$, it is easy to compute $d_k(c)$)?
 - Here, we illustrate that this cipher is vulnerable to a chosen plaintext attack. Alice and Bob choose $p = 2687$ and a secret key. Eve manages to discover the plaintext/ciphertext pairs (1866, 1864) and (1231, 2565). Find the secret key.
- The Discrete Logarithm. Evaluate the following in \mathbb{F}_{23} .
 - $\log_{14}(22)$
 - $\log_{15}(8)$
- Diffie–Hellman Key Exchange. Alice and Bob select and publish

$$p = 918398656403699$$

$$g = 581330380946540.$$

- Alice selects the secret integer $a = 382114$. Compute $A = g^a$. Alice sends A to Bob.
- Bob selects the secret integer $b = 1744891346$. Compute $B = g^b$. Bob sends B to Alice.
- What modular computation does Alice perform to obtain the shared secret? As Alice, compute the shared secret.
- What modular computation does Bob perform to obtain the shared secret? As Bob, compute the shared secret.
