

HOW TO MAKE AN INCLINOMETER:

Fold on the line that is the top edge of the protractor.

Roll the top part into a tube.

Tape the tube closed.

Put a string through the center dot.

Tie a washer to the bottom of the string for a weight.

If you would like to make more accurate sitings, you could either put "crosshairs" in the tube with wires from a straightened paper clip or you could tape a soda straw under the tube and look through it.
